

## Calculation time of DIBS

Depending on the performance of your computer the calculation time per simulated building varies. Two Notebooks have been tested and resulted in the following times:

- Lenovo ThinkPad L480, Win10 x64, Intel Core i7-8550U CPU @ 1.80 GHz 2.00 GHz (8 Cores), 31,9 GB RAM
- Lenovo MIIX 310-10ICR, Win10 x64, Intel Atom x5-Z8350 @ 1,44 GHz 1,44 GHz (4Cores), 4,00 GB RAM

The calculation time per simulated building was 5,0 s/building with the ThinkPad while it reached 41,1 s/building with the MIIX. A reduction of simulation time is expected with increased computational performance.
